Testing an earnings edge

Casablanca | Research date: 10 November 2026 | Prices through 9 November 2026

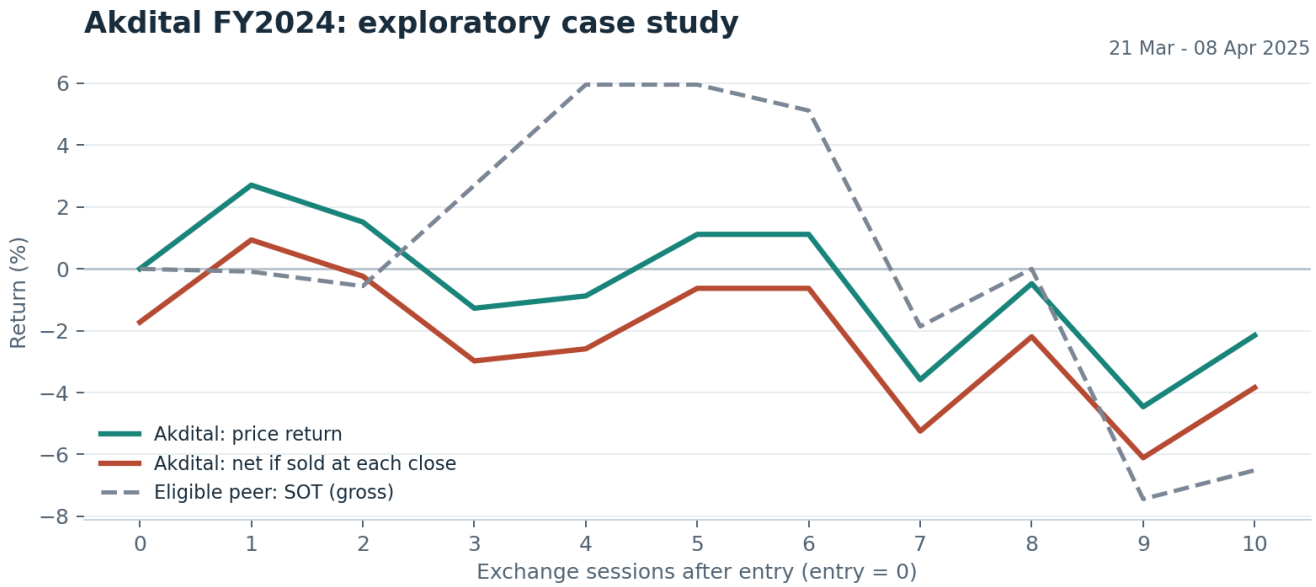

NO VALIDATED ALPHA - NEW SLEEVE ALLOCATION: 0%

The fixed earnings-surprise experiment does not support a tradable alpha. It produced zero fully verified signals. The one exploratory Akdital case lost 3.84% net over ten sessions. A positive comparison with one weak sector peer is insufficient evidence.

Price histories	Collected releases	Forecast records	Direct downloads
64	15 / 8 issuers	21	28 of 35 URLs

The strongest apparent beat: Akdital

AGR's July 2024 document contains a management-plan-derived, pre-money RNPG assumption of 276 million MAD. The issuer reported 315 million on 20 March 2025: an apparent 14.13% gap. Scope and forecast revisions are unresolved, so this is a case study, not a clean analyst-surprise signal. [1, 2]

Trade window	Gross return	Net return	Net - peer gross
21 Mar - 8 Apr 2025	-2.15%	-3.84%	+2.67 pp

Entry: 1,256 MAD. Exit: 1,229 MAD. Ten close-to-close exchange intervals. Fees 0.77% plus slippage 0.10% per side, applied multiplicatively. Peer: SOT, gross return -6.51%. Both stock and peer are price-return proxies; SOT is an imperfect sector comparator.

A small, incomplete event panel

The 64 stock histories are inherited from v6. New collection covers 15 annual results and 21 forecasts, not the whole market. All 35 registered URLs were attempted directly: 28 succeeded and 7 failed. Indexed public web retrieval and manual table checks supplement the download log. Full documents are linked, not redistributed.

Three traps that block deployment

Marsa Maroc: the November forecast implies a 10.17% reported-profit gap. A February update exists before results and has a different, recurring-profit basis; 1,267 versus 1,200 would be only 5.58%. The obsolete forecast is blocked. [3, 4, 5]

Banks FY2025: a newer February 2026 report exists, but its public summary lacks the forecast table needed to confirm or update the July estimates. The six earlier bank forecasts are diagnostic only. [6, 7, 8]

Akdital FY2025: the collected forecast exceeds the 270-day age limit. Company growth rates and forecasts for total consolidated profit are not substituted for comparable RNPG expectations.

Event	Date used	Gap	Net 10d	Evidence status
CFG FY2024	2025-02-19	+2.34%	-6.86%	Comparable match; below 10%
ATW FY2024	2025-02-24	+2.66%	-5.56%	First publication unresolved
BCP FY2024	2025-02-28	-10.60%	-3.44%	First publication unresolved
CIH FY2024	2025-03-13	+4.65%	-8.43%	First publication unresolved
CDM FY2024	2025-03-17	+5.25%	+1.94%	Comparable match; below 10%
MSA FY2024	2025-03-18	+10.17%	-3.57%	Later forecast; basis unresolved
AKT FY2024	2025-03-20	+14.13%	-3.84%	Management-plan scope unresolved
BOA FY2024	2025-03-25	+5.35%	-12.86%	First publication unresolved
CDM FY2025	2026-02-12	+3.97%	-2.61%	Newer bank report unresolved
CFG FY2025	2026-02-18	+2.05%	-13.58%	Newer report + date unresolved
ATW FY2025	2026-02-24	+2.41%	-7.20%	Newer report + date unresolved
BCP FY2025	2026-02-27	-6.66%	-4.21%	Newer report + date unresolved
CIH FY2025	2026-03-16	+0.13%	-5.85%	Newer report + date unresolved
AKT FY2025	2026-03-26	+10.45%	+2.93%	Forecast too old; scope unresolved
BOA FY2025	2026-03-30	+1.92%	-0.25%	Newer report + date unresolved

These returns include misses, small beats and excluded records. Their pooled average is not the strong-surprise strategy. Proxy dates are explicitly flagged; none is silently treated as a first public announcement. The original BOA2024 amount was later checked against its image-only release without changing the value or signal.

Risk controls are implemented

The verified-signal portfolio remains at 1,000,000 MAD in virtual cash. The separately labeled exploratory portfolio bought 39 AKT shares, trimmed 1 after a weight breach, and sold 38 at the scheduled exit. It is a historical software exercise, not a recommended current position.

Exploratory portfolio	Result
Initial virtual capital	1,000,000.00 MAD
Final virtual NAV	998,149.43 MAD
Net P&L	-1,850.57 MAD
Portfolio return	-0.185%
Maximum drawdown	-0.344%
Fees paid	746.61 MAD
Open positions / live orders	0 / 0

Execution rules

Long only, whole shares, no leverage. Entry caps: 5% per stock, 20% per sector, 30% gross. Desired quantities use prior-close information; simulated fills obey both 1% of lagged average shares and 1% of realized daily shares. No replenishment after the initial fill; entry expires after three sessions.

Exits remain queued through illiquidity. Price-driven cap breaches trigger next-session trims. A 5% portfolio drawdown disables entries and queues next-session liquidation. Liquidity and price gaps can prevent or worsen execution: the trigger does not guarantee a 5% maximum loss.

Pre-specified diagnostics: same single case

Scenario	Gross	Net	Net - peer
10 sessions (fixed main test)	-2.15%	-3.84%	+2.67 pp
20 sessions (diagnostic)	+9.79%	+7.90%	-7.54 pp
Entry one session later	-6.67%	-8.28%	-2.32 pp
Double fees and slippage	-2.15%	-5.50%	+1.02 pp

The primary horizon stays at ten sessions. The profitable 20-session outcome is not promoted; it underperforms its peer. The delayed entry loses more. These are variations on one event, not independent observations. Cash earns zero; taxes, settlement, spreads and auction queues remain unmodeled.

What the package lets you do

Extract the ZIP and open RESEARCH_REPORT.html. On Windows, double-click RUN_RESEARCH.bat to create a local environment, install dependencies, run tests and regenerate the study. No API key, Ollama or PowerShell activation is needed. The study runs offline after dependency installation.

The package contains source-linked event and forecast CSVs, direct download hashes and failures, every scenario, cash and share ledgers, pending-order records, a 64-stock research coverage list and an empty live-order file. The protocol is hash-checked. All 70 tests passed in the delivered build, including 23 new earnings tests.

Required before a new trading decision

Expand the dataset without looking at event returns during collection. Archive first publication, comparable earnings definitions, prior estimates and every intervening revision. Verify historical constituents, corporate actions, sector mappings and the exchange calendar. The present period was already inspected; it is not an untouched holdout.

The frozen minimum screen is 30 verified events, 10 issuers and 3 release years, plus positive net sector-relative results, a positive lower 95% issuer-cluster bound, and positive latest-year and double-cost results. Counts alone do not establish significance. In this build the sample and data-integrity gates fail.

The event-screened peer benchmark uses later release dates to remove contaminated peers; it is an ex-post descriptive control. A second benchmark keeps the publication-date liquid peer set fixed. Neither benchmark enters trading decisions. Forecast scope, incomplete peer coverage and a single eligible Akdital peer prevent an alpha claim.
